

# PUBLIC ASSESSMENT REPORT of the Medicines Evaluation Board in the Netherlands

Finasteride Accord 1 mg, film-coated tablets  
Accord Health Care Limited, United Kingdom

## Finasteride

This assessment report is published by the MEB pursuant Article 21 (3) and (4) of Directive 2001/83/EC. The report comments on the registration dossier that was submitted to the MEB and its fellow –organisations in all concerned EU member states.

It reflects the scientific conclusion reached by the MEB and all concerned member states at the end of the evaluation process and provides a summary of the grounds for approval of a marketing authorisation.

This report is intended for all those involved with the safe and proper use of the medicinal product, i.e. healthcare professionals, patients and their family and carers. Some knowledge of medicines and diseases is expected of the latter category as the language in this report may be difficult for laymen to understand.

This assessment report shall be updated by a following addendum whenever new information becomes available.

General information on the Public Assessment Reports can be found on the website of the MEB.

To the best of the MEB's knowledge, this report does not contain any information that should not have been made available to the public. The MAH has checked this report for the absence of any confidential information.

**EU-procedure number: NL/H/1149/001/DC**  
**Registration number in the Netherlands: RVG 100577**

**28 April 2009**

Pharmacotherapeutic group:	Other Dermatologicals
ATC code:	D11AX10
Route of administration:	oral
Therapeutic indication:	treatment of the first stage of the hair loss (androgenetic alopecia) in males. Finasteride Accord 1 mg stabilizes the process of the androgenetic alopecia in the 18-41 year old males. Its effectiveness in bitemporary recession nor in the loss of hair has not been determined.
Prescription status:	prescription only
Date of first authorisation in NL:	24 March 2009
Application type/legal basis:	Directive 2001/83/EC, Article 10(1)
Concerned Member States:	BE (withdrawn), DE, EE, ES, IE (withdrawn), FR (withdrawn), IT, LV, MT, PT, and UK

For product information for healthcare professionals and users, including information on pack sizes and presentations, see Summary of Product Characteristics (SPC), package leaflet and labelling.

## I INTRODUCTION

Based on the review of the quality, safety and efficacy data, the RMS has granted a marketing authorisation for Finasteride Accord 1 mg from Accord Healthcare Limited, UK. The first date of authorisation was on 24 March 2009 in the Netherlands.

The product is indicated for the treatment of the first stage of the hair loss (androgenetic alopecia) in males. Androgenetic alopecia (AGA) in men is characterised by progressive, patterned hair loss from the scalp, beginning with bitemporal recession of the frontal hair line, followed by diffuse thinning over the vertex. Studies in males with androgen insensitivity syndromes and 5 $\alpha$ -reductase type 2 deficiency have suggested that AGA is induced by activation of follicular androgen receptors by dihydrotestosterone (DHT) in genetically susceptible individuals. DHT is thought to play a role in AGA. The influence of androgens on hair is site specific. Finasteride Accord 1mg stabilizes the process of the androgenetic alopecia in the 18-41 year old males. Its effectiveness in bitemporary recession nor in the loss of hair has not been determined.

A comprehensive description of the indications and posology is given in the SPC.

Finasteride belongs to the class of 5 $\alpha$ -reductase inhibitors. It is a competitive inhibitor of type II 5 $\alpha$ -reductase, an intracellular enzyme that converts the androgen testosterone into dihydrotestosterone. Type II 5 $\alpha$ -reductase is found predominantly in liver and genital tissue including the prostate but is also present in some areas of skin.

This decentralised procedure concerns a generic application claiming essential similarity with the innovator product Propecia® 1 mg film-coated tablets, which has been registered in the Netherlands (NL License RVG 27397) by Merck Sharpe & Dohme since 28 June 2002 (original product). In addition, reference is made to Propecia 1 mg film-coated tablets authorisations in the individual Member States (reference product).

*Justification for acceptance:*

As Proscar 5 mg (MSD, UK) has granted an initial marketing authorisation (article 6.1; directive 2001/83/EC) registered more than 10 years in the EEA, and Propecia 1 mg is an additional strength of the former, all these marketing authorisations shall be considered as belonging to the same global marketing authorisation in particular for the purpose of article 10(1).

The marketing authorisation is granted based on article 10(1) and 10(3) of Directive 2001/83/EC.

This type of application refers to information that is contained in the pharmacological-toxicological and clinical part of the dossier of the authorisation of the reference product. A reference product is a medicinal product authorised and marketed on the basis of a full dossier, i.e. including chemical, biological, pharmaceutical, pharmacological-toxicological and clinical data. This information is not fully available in the public domain. Authorisations for generic products are therefore linked to the 'original' authorised medicinal product, which is legally allowed once the data protection time of the dossier of the reference product has expired. For this kind of application, it has to be demonstrated that the pharmacokinetic profile of the product is similar to the pharmacokinetic profile of the reference product. To this end the applicant has submitted one bioequivalence study in which the pharmacokinetic profile of the product is compared with the pharmacokinetic profile of the reference product Propecia® 1 mg film-coated tablets, registered in United Kingdom. A bioequivalence study is the widely accepted means of demonstrating that difference of use of different excipients and different methods of manufacture have no influence on efficacy and safety. This generic product can be used instead of its reference product.

No new preclinical and clinical studies were conducted, which is acceptable for this abridged application.

## II SCIENTIFIC OVERVIEW AND DISCUSSION

### II.1 Quality aspects

#### Compliance with Good Manufacturing Practice

The RMS has been assured that acceptable standards of GMP (see Directive 2003/94/EC) are in place for these product types at all sites responsible for the manufacturing of the active substance as well as for the manufacturing and assembly of this product prior to granting its national authorisation.

#### Active substance and excipients

The active substance is finasteride, an established active substance described in the European Pharmacopoeia. The active substance is practically insoluble in water. It is known that Finasteride may exist in two different polymorphic forms: Form I and Form II. The two forms are distinguished using different techniques.

The ASMF-procedure is used.

The Active Substance Master File (ASMF) procedure is used for the active substance. The main objective of the ASMF procedure, commonly known as the European Drug Master File (EDMF) procedure, is to allow valuable confidential intellectual property or 'know-how' of the manufacturer of the active substance (ASM) to be protected, while at the same time allowing the applicant or marketing authorisation holder (MAH) to take full responsibility for the medicinal product, the quality and quality control of the active substance. Competent Authorities/EMA thus have access to the complete information that is necessary to evaluate the suitability of the use of the active substance in the medicinal product.

Stability data on the active substance have been provided for three full scale batches stored at 25°C/60%RH (36 months) and 40°C/75%RH (6 months). The proposed retest period of 48 months and storage condition 'no additional storage condition' are justified.

#### Medicinal Product

##### Composition

The drug product are reddish brown, round, biconvex, film coated tablets, marked 'F1' on one side and plain on other side containing 1 mg finasteride. The excipients used: lactose monohydrate, microcrystalline cellulose, pregelatinised starch, lauroyl macrogolglycerides, sodium starch glycolate and magnesium stearate. The coating consists of opadry pink. The excipients and packaging are usual for this type of dosage form. The excipients, except for the colouring agent Opadry pink, comply with the Ph. Eur. In house specifications are set for Opadry pink. These specifications are acceptable.

##### Pharmaceutical development

The development of the product has been described, the choice of excipients is justified and their functions explained.

The applicant has compared the dissolution characteristics in several media.

The pharmaceutical development of the product has been adequately performed.

##### Manufacturing process and quality control of the medicinal product

The manufacturing process is divided in 7 main steps:

Raw material blending, sifting, granulation, sizing, final blending, compression, coating and packaging.

The manufacturing process has been adequately validated according to relevant European guidelines. Process validation data on the product has been presented for two pilot scale batches per tablet strength. The product is manufactured using conventional manufacturing techniques. Process validation for full scaled batches will be performed post authorisation.

Stability tests on the finished product

Stability data on the product has been provided on three pilot scale batches per tablet strength stored at 25°C/60%RH (12 months) and 40°C/75%RH (6 months). The conditions used in the stability studies are according to the ICH stability guideline. The batches were stored in alu-alu blister (1 mg tablet). No significant change occurs during the stability studies at accelerated and long term storage condition, therefore a shelf-life of 2 years is acceptable. In view of the stability results it is not considered necessary to include an additional storage condition.

Specific measures concerning the prevention of the transmission of animal spongiform encephalopathies

Except for lactose monohydrate none of the excipients is derived from animal origin, thus no TSE/BSE risk is present. Magnesium stearate is of vegetable origin. Lactose monohydrate is derived from the milk of healthy animals. Supplier's certificates are presented for all excipients stating that the material at issue is TSE/BSE free.

**II.2 Non clinical aspects**

**Good Laboratory Practice**

The RMS has been assured that the non-clinical studies have been conducted in accordance with acceptable standards of Good Laboratory Practice (GLP, see Directives 2004/9/EC and 2004/10/EC).

Finasteride Accord 1 mg is a generic formulation of Propecia® 1 mg which is available on the European market. No new preclinical data have been submitted, and therefore the application has not undergone preclinical assessment. This is acceptable for this type of application.

**Environmental risk assessment**

The product is intended as a substitute for other identical products on the market. The approval of this product will not result in an increase in the total quantity of finasteride released into the environment. It does not contain any component, which results in an additional hazard to the environment during storage, distribution, use and disposal.

**II.3 Clinical aspects**

Finasteride is a well known active substance with established efficacy and tolerability.

The content of the SPC approved during the decentralised procedure is in accordance with the SPC approved for procedure SE/H/0158/001/E001/MR.

For this generic application, the MAH has submitted one bioequivalence study in which the pharmacokinetic profile of the test product Finasteride Accord 1 mg film-coated is compared with the pharmacokinetic profile of the reference product Propecia® 1 mg film-coated tablet.

This was a single-dose, 2-way cross-over study. Thirty (+ 1 standby) healthy male subjects, aged 19 - 40 years, were included in this study. Each subject received a single dose (1 mg; 1 x 1 mg tablet) of both the test and reference finasteride formulations. The tablets were administered in solid form with 240 ml water after an overnight fast of at least 10h. For each subject there were 2 dosing periods, separated by a washout period of 5 days. Blood samples were taken pre-dose and at 0.25, 0.5, 0.75, 1, 1.25, 1.5, 1.75, 2, 2.33, 2.67, 3, 3.5, 4, 5, 6, 8, 12, 16, 20, 24, 30, and 36 hours after administration of the products.

Data obtained from 30 subjects were taken into account (table 1).

*Table 1: Pharmacokinetic parameters (non-transformed values; arithmetic mean  $\pm$  SD,  $t_{max}$  median, range).*

Treatment n=30	AUC <sub>0-t</sub> ng/ml/h	AUC <sub>0-∞</sub> ng/ml/h	C <sub>max</sub> ng/ml	t <sub>max</sub> h	t <sub>1/2</sub> h
Test	79.0 $\pm$ 28.0	82.7 $\pm$ 30.6	11.5 $\pm$ 2.6	1.50	6.3 $\pm$ 2.6
Reference	72.7 $\pm$ 21.0	75.7 $\pm$ 22.5	10.7 $\pm$ 2.0	1.75	5.8 $\pm$ 2.2
*Ratio (90% CI)	1.06 (1.02 – 1.10)	1.06 (1.02 – 1.10)	1.06 (1.00 – 1.11)		
CV (%)	8.8 %	8.6 %	12.3 %		
AUC <sub>0-∞</sub> area under the plasma concentration-time curve from time zero to infinity AUC <sub>0-t</sub> area under the plasma concentration-time curve from time zero to t hours C <sub>max</sub> maximum plasma concentration t <sub>max</sub> time for maximum concentration (median) t <sub>1/2</sub> half-life					

*\*In-transformed values*

Based on the pharmacokinetic parameters of finasteride, the reference and test are considered bioequivalent with respect to the extent and rate of absorption. The 90% confidence intervals calculated for AUC<sub>(0-t)</sub>, AUC<sub>(0-inf)</sub> and C<sub>max</sub> of finasteride were inside the normal range of acceptability (0.80 – 1.25).

The choice of the reference product in the bioequivalence study has been justified by comparison of dissolution results and compositions of reference products in different Member States.

The formula and preparation of the bioequivalence batch of finasteride is identical to the formula proposed for marketing.

The RMS has been assured that the bioequivalence study has been conducted in accordance with acceptable standards of Good Clinical Practice (GCP, see Directive 2005/28/EC) and Good Laboratory Practice (GLP, see Directives 2004/9/EC and 2004/10/EC).

#### Readability test

The package leaflet has been evaluated via an user consultation study in accordance with the requirements of Articles 59(3) and 61(1) of Directive 2001/83/EC. The readability test has been adequately performed. The test process involved two rounds in a sufficient number of participants.

#### Risk Management Plan

Finasteride was first approved in 1992, and there is now more than 10 years post-authorisation experience with the active substance. The safety profile of finasteride can be considered to be well established and no product specific pharmacovigilance issues were identified pre- or postauthorisation, which are not adequately covered by the current SPC. Additional risk minimisation activities have not been identified for the reference medicinal product. The MAH has a pharmacovigilance system at their disposal, which is based on the current European legislation. Routine pharmacovigilance activities are sufficient to identify actual or potential risks and a detailed European Risk Management Plan is not necessary for this product.

#### PSUR cyclus and renewal date

The PSUR submission cycle is 3 years. European harmonised birth date has been allocated (17 April 1998) and subsequently the first data lock point for finasteride is August 2010. The 1<sup>st</sup> PSUR will cover the period until August 2010.

The proposed date for the first renewal is agreed to be 1 April 2011.

### III OVERALL CONCLUSION AND BENEFIT-RISK ASSESSMENT

Finasteride Accord 1 mg is a generic form of Propecia® 1 mg film-coated tablets. Propecia® 1 mg film-coated tablets are a well-known medicinal product with an established favourable efficacy and safety profile.

Bioequivalence has been shown to be in compliance with the European guidance documents. The SPC is consistent with that of the reference product.

The MAH has provided written confirmation that systems and services are in place to ensure compliance with their pharmacovigilance obligations.

The SPC, package leaflet and labelling are in the agreed templates. Braille conditions are met by the MAH.

The Board followed the advice of the assessors. The concerned member states, on the basis of the data submitted, considered that Accord Health Care Limited has demonstrated bioequivalence for Finasteride Accord 1 mg film-coated tablets with the reference product.

However one particular member state did not recognise the Dutch evaluation for the marketing authorisation. That particular member state claimed that the risk/benefit ratio was negative as finasteride can be an important causal factor in the occurrence of infertility in young men. Moreover an increase of urogenital malformations was mentioned among boys born from fathers taking finasteride during the 6 months before conception. Advice was sought by the PhVWP (October 2008)

In the CMD(h) meeting of November 18<sup>th</sup> 2008, the following was discussed:

1. Is it to be expected that in males using finasteride epigenetic modifications can occur in the germ cells? If so can these modifications cause birth defects in offspring?
2. What is the likelihood of urogenital birth defects in boys when the mother is exposed to finasteride by semen until she is aware to be pregnant.
3. What is the likelihood of feminization of the male foetus in a pregnant woman when a male (on finasteride) takes all precautions as described in the SPC to avoid exposure to his pregnant partner (i.e. is the risk acceptable or not).

The CMD(h) decided:

Because of a possible increased risk of male infertility section 4.4 *Special warnings and precautions for use* of the proposed SPC for Finasteride Accord 1 mg should be amended by adding to the second paragraph: **"Patients who are planning to father a child should consider to stop treatment (see also section 4.6)."** The addition "see also section 4.6" of the cross reference to section 4.6 was asked by Belgium, the RMS find this addition acceptable.

The following warning should be added to the package leaflet under the heading *Take special care with Finasteride Accord 1 mg*: **"Finasteride may affect male fertility. Patients who are planning to father a child should consider stopping treatment."**

The other concerns expressed by the particular member state, e.g. urogenital malformation and the indication of feminization of the male foetus, are sufficiently addressed in the proposed SPC.

## List of abbreviations

ASMF	Active Substance Master File
ATC	Anatomical Therapeutic Chemical classification
AUC	Area Under the Curve
