CBG MEB

PUBLIC ASSESSMENT REPORT of the Medicines Evaluation Board in the Netherlands

Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution
Dr. Friedrich Eberth Arzneimittel GmbH, Germany

ofloxacin

This assessment report is published by the MEB pursuant Article 21 (3) and (4) of Directive 2001/83/EC. The report comments on the registration dossier that was submitted to the MEB and its fellow –organisations in all concerned EU member states.
It reflects the scientific conclusion reached by the MEB and all concerned member states at the end of the evaluation process and provides a summary of the grounds for approval of a marketing authorisation.
This report is intended for all those involved with the safe and proper use of the medicinal product, i.e. healthcare professionals, patients and their family and carers. Some knowledge of medicines and diseases is expected of the latter category as the language in this report may be difficult for laymen to understand.

This assessment report shall be updated by a following addendum whenever new information becomes available.

General information on the Public Assessment Reports can be found on the website of the MEB.

To the best of the MEB's knowledge, this report does not contain any information that should not have been made available to the public. The MAH has checked this report for the absence of any confidential information.

EU-procedure number: NL/H/2393/001/DC
Registration number in the Netherlands: RVG 109912

22 January 2013

Pharmacotherapeutic group:	Ophthalmologicals, other antiinfectives
ATC code:	S01AX11
Route of administration:	ocular use
Therapeutic indication:	Topical treatment of external ocular infections such as bacterial conjunctivitis and keratitis in adults and children caused by ofloxacin - sensitive organisms.
Prescription status:	prescription only
Date of authorisation in NL:	26 November 2012
Concerned Member States:	Decentralised procedure with DE, AT
Application type/legal basis:	Directive 2001/83/EC, Article 10(3)

For product information for healthcare professionals and users, including information on pack sizes and presentations, see Summary of Product Characteristics (SPC), package leaflet and labelling.

I INTRODUCTION

Based on the review of the quality, safety and efficacy data, the member states have granted a marketing authorisation for Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution, from Dr. Friedrich Eberth Arzneimittel GmbH. The date of authorisation was on 26 November 2012 in the Netherlands.

The product is indicated for topical treatment of external ocular infections such as bacterial conjunctivitis and keratitis in adults and children caused by ofloxacin-sensitive organisms. Consideration should be given to official guidance on the appropriate use of antibacterial agents.

A comprehensive description of the indications and posology is given in the SPC.

The derivative of chinolonic acid, ofloxacin, is a gyrase inhibitor of the fluoroquinolone sub-group with bactericidal effect.
Development of resistance to fluoroquinolones by the sensitive bacteria generally happens by mutation of the gyrA gene that codes for the A subunit of DNA gyrase. In addition, active efflux is responsible for low-level resistance that might act as a first step in resistance selection. Resistance can occur through a multistep process with subsequent mutations producing a progressively higher level of resistance in a stepwise fashion. Species of borderline susceptibility can become resistant in a single mutational step.
Plasmid-mediated resistance has been found in *E. coli* and *Klebsiella* organisms.
Bacteria resistant to one fluoroquinolone show cross-resistance to other members of the quinolone-group.

This decentralised procedure concerns a hybrid application claiming essential similarity with the innovator product Floxal EDO Augentropfen 3 mg/ml, eye drops, solution, registered by Dr. Gerhard Mann Chem.-pharm. Fabrik GmbH since 1996. In the Netherlands, the reference product Trafloxal E.D.O., eyedrops 3 mg/ml, solution (NL License RVG 29805), has been registered since 2006 by Bausch & Lomb Pharma.

The marketing authorisation is granted based on article 10(3) of Directive 2001/83/EC, hybrid application, as bioequivalence cannot be demonstrated through bioavailability studies.

This type of application refers to information that is contained in the pharmacological-toxicological and clinical part of the dossier of the authorisation of the reference product. A reference product is a medicinal product authorised and marketed on the basis of a full dossier, i.e. including chemical, biological, pharmaceutical, pharmacological-toxicological and clinical data. This information is not fully available in the public domain. Authorisations for generic products are therefore linked to the 'original' authorised medicinal product, which is legally allowed once the data protection time of the dossier of the reference product has expired.
As Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution is a product for ocular use (eye drops) intended to act without systemic absorption, with qualitatively the same excipients used in the reference product, it is exempted for biostudy (Guideline CPMP/239/95 on locally applied, locally acting products, containing known constituents).

No scientific advice has been given to the MAH with respect to this product and no paediatric development programme has been submitted, as this is not required for a generic application.

II SCIENTIFIC OVERVIEW AND DISCUSSION

II.1 Quality aspects

Compliance with Good Manufacturing Practice
The MEB has been assured that acceptable standards of GMP (see Directive 2003/94/EC) are in place for this product type at all sites responsible for the manufacturing of the active substance as well as for the manufacturing and assembly of this product prior to granting its national authorisation.

Active substance
The active substance is ofloxacin, an established active substance described in the European Pharmacopoeia (Ph.Eur.*). The active substance is used as a racemate. It is a pale yellow or bright yellow, crystalline powder, which is slightly soluble in water. As the drug substance is dissolved in the course of the manufacturing process of the drug product, the polymorphic form as well as the particle size of the drug substance is not relevant. The drug substance is very sensitive to light.

The CEP procedure is used for the active substance. Under the official Certification Procedures of the EDQM of the Council of Europe, manufacturers or suppliers of substances for pharmaceutical use can apply for a certificate of suitability concerning the control of the chemical purity and microbiological quality of their substance according to the corresponding specific monograph, or the evaluation of reduction of Transmissible Spongiform Encephalopathy (TSE) risk, according to the general monograph, or both. This procedure is meant to ensure that the quality of substances is guaranteed and that these substances comply with the European Pharmacopoeia.

Manufacturing process
A CEP has been submitted; therefore no details on the manufacturing process have been included.

Quality control of drug substance
The drug substance specification is in accordance with the Ph.Eur. and the CEP and contains additional requirements for microbial contamination. The specification is acceptable.
Batch analytical data demonstrating compliance with the drug substance specification were provided for two commercial scale batches.

Stability of drug substance
No stability data were provided as this aspect is covered by the CEP. The re-test period of the substance is 3 years.

** Ph.Eur. is an official handbook (pharmacopoeia) in which methods of analysis with specifications for substances are laid down by the authorities of the EU.*

Medicinal Product

Composition
Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution, is a clear, slightly greenish yellow solution with pH 6.5 to 7.5 and osmolality of 260 to 330 mOsmol/kg.

The eye drops are packed in in transparent 0.5 ml low-density polyethylene (LDPE) single-dose containers. 5 single-dose containers at a time are packed in an aluminium pouch. This pouch consists of aluminium / LDPE.

The excipients are: sodium chloride, hydrochloric acid and sodium hydroxide solution (for pH-adjustment), water for injections.
The excipients and packaging are usual for this type of dosage form.

Pharmaceutical development

The development of the product has been described, the choice of excipients is justified and their functions explained. The quantitative composition of the drug product in terms of the active ingredient ofloxacin and the qualitative composition of the drug product in terms of excipients is identical with the reference medicinal product Floxal EDO eye drops, solution, a formulation containing 3 mg/mL ofloxacin. Due to the local action of the drug product, no bioequivalence study was performed. Instead, the MAH compared the generic and the reference product Floxal EDO Augentropfen 3 mg/ml, eye drops, solution with regard to physicochemical parameters (pH, relative density, osmolality, ofloxacin content, sodium chloride content and related substances). Comparison of the generic and the reference product did not include the parameter viscosity, presumably as no viscosity-increasing agent is included in the formulation. This is acceptable. The products were comparable on these aspects. In addition, one drop of the generic product delivers the same dose as the reference product. The generic and the reference product are regarded to be comparable from a chemical-pharmaceutical point of view. No overages are applied. However, in order to guarantee the nominal declared amount, an overfill of about 0.03 mL per container is applied.
The manufacturing process involves sterile filtration followed by aseptic filling using blow-fill-seal technology. This is a common manufacturing process for eye drops packed in unit dose containers. Due to the use of LDPE as packaging material, terminal sterilization is not possible.
Overall, pharmaceutical development was adequately performed.

Manufacturing process
The manufacturing process involves dissolution of the drug substance and excipients in water for injections, sterilisation by filtration and aseptic filling using the blow-fill-seal technology. The manufacturing process was sufficiently described. Due to the aseptic processing step, the manufacturing process is considered to be non standard requiring process validation on three consecutive production scale batches. Satisfactory process validation data on three production-scale batches were provided.

Control of excipients
All excipients comply with the European Pharmacopoeia. These specifications are acceptable.

Quality control of drug product
The product specification includes tests for appearance (clarity and opalescence, colour), identity of ofloxacin, relative density, pH, osmolality, assay of ofloxacin, purity, extractable volume, sterility, and particulate contamination (sub-visible particles). The release and shelf life specifications differ with regard to the limits for related substances. The drug product specification is acceptable.
The analytical methods were adequately described and validated.
Batch analytical data from the proposed production site were provided on five batches of the proposed commercial batch size. All batches complied with the release specification.

Stability of drug product
Stability data on the product was provided on five batches of the proposed commercial batch size stored at 25°C/60% RH (three batches for 36 months and two batches for 24 months), 30°C/65% (three batches for 12 months) and 40°C/75% RH (six months). The conditions used in the stability studies are according to the ICH stability guideline. The drug product was packed in the proposed commercial packaging (LDPE unit dose containers). The containers were stored with and without laminated aluminium pouches. In the containers stored in pouches, increases were seen in impurity levels. No out of specification results were observed. In the unpacked containers, out of specification results were observed for impurities, evaporative loss, and assay after six months at long term and three months at accelerated storage conditions. Results of a photostability study under ICH conditions showed that the drug product is extremely sensitive to light.
Based on the provided stability data, the claimed shelf life of 24 months for the drug product packed in the laminated aluminium pouches and the claimed shelf life of one month after opening of the pouches are acceptable. The proposed storage conditions “Do not store above 25°C”, “Store in the original package in order to protect from light”, and “Do not refrigerate or freeze” are acceptable.

Specific measures concerning the prevention of the transmission of animal spongiform encephalopathies

There are no substances of ruminant animal origin present in the products nor have any been used in the manufacturing of this product, so a theoretical risk of transmitting TSE can be excluded.

II.2 Non-clinical aspects

This product is a generic formulation of Floxal EDO Augentropfen 3 mg/ml, eye drops, solution, which is available on the European market. A non-clinical overview on the pharmacology, pharmacokinetics and toxicology has been provided, which is based on up-to-date and adequate scientific literature. The overview justifies why there is no need to generate additional non-clinical pharmacology, pharmacokinetics and toxicology data. Therefore, the member states agreed that no further non-clinical studies are required. The non-clinical overview on the pre-clinical pharmacology, pharmacokinetics and toxicology is adequate.

Environmental risk assessment
The product is intended as a substitute for other identical products on the market. The approval of this product will not result in an increase in the total quantity of ofloxacin released into the environment. It does not contain any component, which results in an additional hazard to the environment during storage, distribution, use and disposal. However, a short environmental risk assessment was provided.

Substance (INN/Invented Name): Ofloxacin			
CAS-number (if available): 82419-36-1			
PBT screening		Result	**Conclusion**
Bioaccumulation potential- log K_{ow}	OECD107	-0.48	not PBT
PBT-assessment			
Parameter	**Result relevant for conclusion**		**Conclusion**
Bioaccumulation	log K_{ow}	-0.48	not B
	BCF	not assessed	
Persistence	DT50 or ready biodegradability	not assessed	
Toxicity	NOEC or CMR	not assessed	
PBT-statement :	The compound is not considered as PBT nor vPvB		
Phase I			
Calculation	**Value**	**Unit**	**Conclusion**
PEC $_{surfacewater}$, default or refined (e.g. prevalence, literature)	0.0039	µg/L	< 0.01 threshold
Other concerns (e.g. chemical class)	not assessed		

$PEC_{surface\ water}$ for ofloxacin value is below the action limit of 0.01 µg/L and ofloxacin is not a PBT (persistent, bioaccumulative and toxic), nor vPvB (very persistent and very bioaccumulative) substance as log K_{ow} does not exceed 4.5.

II.3 Clinical aspects

Ofloxacin is a well-known active substance with established efficacy and tolerability.

A clinical overview has been provided, which is based on scientific literature. The overview justifies why there is no need to generate additional clinical data. Therefore, the member states agreed that no further clinical studies are required.

For oral solutions no bioequivalence studies are necessary, however excipients which may affect absorption etc. should be taken into account. This is also applicable for this aqueous ofloxacin eye drop solution. The Guideline on requirements for locally applied, locally acting products, containing known constituents (CPMP/239/05) states that in order to demonstrate therapeutic equivalence clinical trials are in principal necessary, but other models may be used or developed. This formulation is qualitatively identical to the reference medicinal product. Therefore. a biowaiver is agreed.
Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution may be considered as therapeutic equivalent, with the same efficacy/safety profile as known for the active substance of the reference medicinal product. The current product can be used instead of its reference product.

Risk management plan
Ofloxacin was first approved in 1990, and there is now more than 10 years post-authorisation experience with the active substance. The safety profile of ofloxacin can be considered to be well established and no product specific pharmacovigilance issues were identified pre- or post authorisation which are not adequately covered by the current SPC. Additional risk minimisation activities have not been identified for the reference medicinal product. The MAH has a pharmacovigilance system at their disposal, which is based on the current European legislation. Routine pharmacovigilance activities are sufficient to identify actual or potential risks and a detailed European Risk Management Plan is not necessary for this product

Product information

SPC
The content of the SPC approved during the decentralised procedure is based on that accepted for the reference product Floxal EDO Augentropfen 3mg/ml, eye drops solution and has been amended in accordance with current knowledge.

Readability test
Readability testing was performed for the German package leaflet of a product which has the same qualitative and quantitative composition as Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution. Both medicinal products are manufactured by the same manufacturer.
Both products are ophthalmic preparations proposed for the same indications and containing the same active substance in the same strength. Thus, the product information for the two products is comparable.

Both PL are similar in layout and content. The successful user test is also applicable for Ofloxacine Eberth Unit Dose.
The readability test has been sufficiently performed.

III OVERALL CONCLUSION AND BENEFIT-RISK ASSESSMENT

Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution has a proven chemical-pharmaceutical quality and is a hybrid form of Floxal EDO Augentropfen 3 mg/ml, eye drops, solution. Floxal EDO is a well-known medicinal product with an established favourable efficacy and safety profile.

A clinical overview has been provided, which is based on scientific literature. The member states agreed that no further clinical studies are required.
Ofloxacine Eberth Unit Dose 3 mg/ml is a product for ocular use (eye drops) intended to act without systemic absorption, with the same excipients used in the reference product, it is exempted for biostudy.

The MAH has provided written confirmation that systems and services are in place to ensure compliance with their pharmacovigilance obligations.

The SPC is based on that of the reference product. The SPC, package leaflet and labelling are in the agreed templates and are in agreement with other ofloxacin containing products.

The Board followed the advice of the assessors.

There was no discussion in the CMD(h). Agreement between member states was reached during a written procedure. The member states, on the basis of the data submitted, considered that essential similarity has been demonstrated for Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution with the reference product, and have therefore granted a marketing authorisation. The decentralised procedure was finished on 31 August 2012. Ofloxacine Eberth Unit Dose 3 mg/ml eye drops, solution is authorised in the Netherlands on 26 November 2012.

The date for the first renewal will be: 31 August 2017.

There were no post-approval commitments made during the procedure.
