

1. NAAM VAN HET GENEESMIDDEL

Colecalciferol 1A Pharma 25.000 IE, zachte capsules
Colecalciferol 1A Pharma 50.000 IE, zachte capsules

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each soft capsule contains 0.625 mg colecalciferol (Vitamin D3), equivalent to 25,000 IU.
Each soft capsule contains 1.25 mg colecalciferol (Vitamin D3), equivalent to 50,000 IU.

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Soft capsule.

{[Nationally completed name] 25,000 IU soft capsules} soft capsules are white opaque, size 3, oval soft capsules. Capsule length is approximately 11.3 mm and width is approximately 6.9 mm.

{[Nationally completed name] 50,000 IU soft capsules} are red opaque, size 6, oval soft capsules. Capsule length is approximately 13.5 mm and width is approximately 8.4 mm.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Initial treatment of clinically relevant vitamin D deficiency (serum level < 25 nmol/L (<10 ng/mL)) in adults.

{[Nationally completed name]} 25,000IU and 50,000 IU soft capsules are indicated in adults.

4.2 Posology and method of administration

Posology

The dosage must be determined individually by the treating doctor depending on the extent of the necessary vitamin D supplementation. The dose should be adjusted dependent upon desirable serum levels of 25- hydroxycolecalciferol (25(OH)D), severity of the disease and patients response to treatment.

The patient's dietary habits should be carefully evaluated and artificially added vitamin D content of certain food types should be taken into consideration.

The initial loading dose of in total 100,000 IU can be achieved by EITHER, 1 capsule of 25,000IU /week for up to 4 weeks OR 1 to 2 capsules of 50,000 IU in one week.

After completion of this loading dose, a lower maintenance dose should be considered, dependent upon desirable serum levels of 25-hydroxycolecalciferol (25(OH)D), the severity of the disease and the patient's response to treatment.

Alternatively, national posology recommendations in treatment of vitamin D deficiency can be followed.

Special populations

Hepatic impairment

No dose adjustment is required in patients with hepatic impairment.

Renal impairment

Colecalciferol is contraindicated in patients with severe renal impairment (see section 4.3).

Paediatric population

{[Nationally completed name]} should not be used in children and adolescents.

Method of administration

Oral administration

The capsules should be swallowed whole (not chewed) with water.

4.3 Contraindications

- Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.
- Diseases/conditions associated hypercalcaemia and / or hypercalciuria.
- Calcium nephrolithiasis, nephrocalcinosis
- D- hypervitaminosis
- Severe renal impairment

4.4 Special warnings and precautions for use

Calcium levels

In the case of therapeutic treatment, the dose should be established on an individual basis for the patients by regular checking of plasma calcium levels. During treatment the serum calcium values, urinary calcium excretion and renal function must be monitored, especially in elderly patients who concomitantly take cardiac glycosides or diuretics (see section 4.5), and in the case of hyperphosphataemia, as well as for patients with an increased risk of lithiasis. In case of hypercalcaemia or hypercalciuria (exceeding 300 mg (7.5 mmol)/24 hours) treatment has to be

discontinued (see section 4.3). In case of impaired renal function, the dose should be reduced or the treatment discontinued.

During treatment proper calcium levels and adequate calcium intake preferably by nutrition should be ensured. Concomitant use of calcium containing products administered in large doses may increase the risk of hypercalcaemia.

Impaired renal function

Vitamin D should be used with caution in patients with impairment of renal function and the effect on calcium and phosphate levels should be monitored. The risk of soft tissue calcification should be taken into account. In patients with severe renal insufficiency, vitamin D in the form of colecalciferol may not be metabolised normally and {[Nationally completed name]} is contraindicated (see section 4.3).

Pseudohypoparathyroidism

Colecalciferol should not be taken if pseudohypoparathyroidism is present (the need for vitamin D may be reduced by the sometimes normal sensitivity to vitamin D, with a risk of long-term overdose). In such cases, more manageable vitamin D derivatives are available.

Sarcoidosis

Vitamin D₃ should be prescribed with caution to patients suffering from sarcoidosis because of the risk of increased metabolism of vitamin D to its active form. These patients should be monitored with regard to the calcium content in serum and urine.

Concomitant use of multivitamin products

The content of vitamin D in {[Nationally completed name]} should be considered when prescribing other medicinal products containing vitamin D. The concomitant use of multivitamin products and dietary supplements containing vitamin D should be avoided. This also applies to metabolites or analogues of vitamin D.

Paediatric population

{[Nationally completed name]} should not be used in children and adolescents (< 18 years).

Available studies are too limited to provide sufficient well-established reassurance on the safe use of very high doses in children and adolescents.

4.5 Interaction with other medicinal products and other forms of interaction

Thiazide diuretics

Thiazide diuretics reduce the excretion of calcium with urine. Regular monitoring of the serum calcium level is necessary in the case of concomitant use with thiazide diuretics or with calcium containing products taken in large doses because of the increased risk of hypercalcaemia.

Digitalis and other cardiac glycosides

In cases of treatment with medicinal product containing digitalis and other cardiac glycosides, the administration of vitamin D may increase the risk of digitalis toxicity (arrhythmia). Strict medical supervision is needed and, if necessary monitoring of ECG and calcium.

Systemic corticosteroids

Systemic corticosteroids inhibit the absorption of calcium. Long-term use of corticosteroids may offset the effect of vitamin D.

Ion exchange resins, laxatives and orlistat

Simultaneous treatment with ion exchange resins (e.g. colestyramine), or laxatives (like paraffin oil) may reduce the gastrointestinal absorption of vitamin D. Orlistat may potentially impair the absorption of vitamin D as it is fat-soluble. Vitamin D may not be taken within 2 hours (before or after) any orlistat and vitamin D analog administration.

Magnesium

Products containing magnesium (like antacids) may not be taken during vitamin D treatment because of the risk of hypermagnesaemia.

Anticonvulsants and barbiturates

Anticonvulsants, like phenytoin and barbiturates (e.g. primidone) may reduce the effect of vitamin D due to the activation of the microsomal enzyme system.

Products containing phosphor

Products containing phosphor used in large doses, given concomitantly may increase the risk of hyperphosphataemia.

Actinomycin and imidazole antifungal agents

The cytotoxic agent actinomycin and imidazole antifungal agents interfere with vitamin D activity by inhibiting the conversion of 25-hydroxyvitamin D to 1,25-dihydroxyvitamin D by the kidney enzyme 25-hydroxyvitamin D-1-hydroxylase.

Ketoconazole

Ketoconazole may inhibit both synthetic and catabolic enzymes of vitamin D. Reductions in serum endogenous vitamin D concentrations have been observed following the administration of 300 mg/day to 1,200 mg/day ketoconazole for a week to healthy men. However, *in vivo* drug interaction studies of ketoconazole with vitamin D have not been investigated.

Rifampicin

Rifampicin may also reduce the effectiveness of vitamin D₃ due to hepatic enzyme induction.

Isoniazid

Isoniazid may reduce the effectiveness of vitamin D₃ due to inhibition of the metabolic activation of vitamin D.

4.6 Fertility, pregnancy and lactation

During pregnancy and breastfeeding this high dosed product is not recommended and a lower dosed product should be used.

During pregnancy and breast-feeding adequate vitamin D intake is necessary.

Pregnancy

There are no or limited amount of data from the use of colecalciferol in pregnant women. Studies in animals have shown reproductive toxicity at high doses. High doses of vitamin D have been shown to have teratogenic effects in animal experiments (see section 5.3).

However, overdose of vitamin D must be avoided during pregnancy, as prolonged hypercalcaemia may lead to physical and mental retardation, supravalvular aortic stenosis and retinopathy of the child. Where there is a vitamin D deficiency the recommended dose is dependent on national guidelines, however, the maximum recommended dose during pregnancy is 4,000 IU/day vitamin D3. For treatment during pregnancy at higher doses, {[Nationally completed name]} is not recommended during pregnancy.

Breast-feeding

High-dose vitamin D should not be used during breastfeeding. Vitamin D and its metabolites pass into breast milk. If treatment with vitamin D is clinically indicated during breastfeeding this should be considered when giving additional vitamin D to the child.

Fertility

There are no data on the effect of colecalciferol on fertility. However, normal endogenous levels of vitamin D are not expected to have any adverse effects on fertility.

4.7 Effects on ability to drive and use machines

{[Nationally completed name]} has no or negligible influence on the ability to drive and use machines.

Investigations have not been performed.

4.8 Undesirable effects

The frequency of possible adverse reactions listed below are defined as:

Very common ($\geq 1/10$)

Common ($\geq 1/100$ to $<1/10$)

Uncommon ($\geq 1/1,000$ to $<1/100$)

Rare ($\geq 1/10,000$ to $<1/1,000$)

Very rare ($<1/10,000$)

Not known (cannot be estimated from the available data)

The adverse reactions are the result of overdose.

Immune system disorders:

Not known (cannot be estimated from the available data): Hypersensitivity reactions such as angio-oedema or laryngeal oedema

Metabolism and nutrition disorders:

Uncommon: Hypercalcaemia and hypercalciuria.

Gastrointestinal disorders:

Not known: Constipation, flatulence, nausea, abdominal pain, diarrhoea.

Skin and subcutaneous disorders:

Rare: Pruritus, rash and urticaria.

Dependent on dose and duration of treatment of serious and persistent hypercalcemia with its acute (heart rhythm disturbances, nausea, vomiting, psychiatric symptoms, loss of consciousness) and chronic (increased urination, increased thirst, loss of appetite, weight loss, kidney stones, kidney calcification, calcification may in tissues outside the bone) episodes occur.

Very rarely fatality has been described (see 4.4 "Special warnings and precautions for use" and 4.9 "overdose").

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions **the national reporting system listed in Appendix V***.

4.9 Overdose

Symptoms of overdose

Overdose of the product may cause hypervitaminosis, hypercalcaemia and hyperphosphatemia. Acute or chronic overdose of vitamin D can cause hypercalcaemia. Symptoms of hypercalcemia are tiredness, headache, muscle and joint pain, muscle weakness, psychiatric symptoms (e.g., euphoria, dazedness, and disturbed consciousness), nausea, vomiting, lack of appetite, weight loss, thirst, polyuria, formation of renal calculi, nephrocalcinosis, extraosseous calcification and kidney failure, changes in ECG, arrhythmias, and pancreatitis. Chronic overdoses can lead to vascular and organ calcification as a result of hypercalcaemia. Hypercalcaemia in extreme cases may lead to coma or even death.

Therapeutic measures in overdose

A specific antidote does not exist. As a first measure the vitamin D preparation should be discontinued; normalization of hypercalcemia due to vitamin D intoxication takes several weeks. At the same time, the use of thiazide diuretics, lithium, vitamin D and A as well as cardiac glycosides should also be discontinued. Depending on the degree of hypercalcaemia and on the patient's condition, e.g. in case of oligoanuria, haemodialysis (calcium-free dialysate) may be necessary.

Graded according to the degree of hypercalcemia, the treatment is directed to symptoms. Rehydration and treatment with diuretics, e.g. furosemide to ensure adequate diuresis. In hypercalcemia biphosphonates or calcitonin and corticosteroids may be given. Serum electrolyte levels, renal function and diuresis should be monitored. In severe cases ECG and central venous pressure monitoring may be necessary.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Vitamin D and analogues, colecalciferol ATC Code: A11CC05

Colecalciferol (vitamin D₃) is formed in the skin on exposure to UVB light and converted into its biologically active form, 1,25-dihydroxycolecalciferol, in two hydroxylation steps, first in the liver (position 25) and then in the renal tissue (position 1). Along with parathormone and calcitonin, 1,25-dihydroxycolecalciferol has a considerable impact on the regulation of calcium and phosphate metabolism. In vitamin D deficiency the skeleton does not calcify (resulting in rickets) or decalcification of bones occurs (resulting in osteomalacia).

According to production, physiological regulation and mechanism of action, vitamin D₃ is to be considered as precursor of a steroid hormone. In addition to physiological production in the skin, colecalciferol can be supplied via the diet or in the form of a medicinal product. Since in the latter case the product inhibition of cutaneous vitamin D synthesis is circumvented, overdose and intoxications may occur.

5.2 Pharmacokinetic properties

Absorption

Vitamin D is easily absorbed in the small intestine. Food intake potentially increases the absorption of vitamin D.

Distribution and biotransformation

Colecalciferol and its metabolites circulate in the blood bound to a specific globulin. Colecalciferol is converted in the liver by hydroxylation to 25-hydroxycolecalciferol. It is then further converted in the kidneys to 1,25-dihydroxycolecalciferol. 1,25-dihydroxycolecalciferol is the active metabolite responsible for increasing calcium absorption. Vitamin D, which is not metabolised, is stored in adipose and muscle tissues.

After a single oral dose of colecalciferol, the maximum serum concentrations of the primary storage form are reached after approximately 7 days. 25(OH)D₃ is then slowly eliminated with an apparent half-life in serum of about 50 days.

Elimination

Colecalciferol and its metabolites are excreted mainly in the bile and faeces. A small percentage of an administered dose is found in urine.

Special population

A defect in the metabolism and excretion of vitamin D has been described in patients with chronic renal failure.

5.3 Preclinical safety data

Effects in non-clinical single and repeat-dose toxicity studies were observed only at exposures of high doses. At very high doses teratogenicity was observed in animal studies. Normal endogenous levels of colecalciferol has no potential mutagenic activity (negative in Ames-test). Tests on carcinogenicity activity have not been conducted.

There is no further information of relevance to the safety assessment in addition to what is stated in other parts of the Summary of Product Characteristics.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Capsule fill

Butylhydroxytoluene (BHT) (E-321)
Medium chain triglyceride oil

Capsule shell

Gelatin (E-441)
Glycerol 99.5% (E-422)
Titanium dioxide (E-171)
Water purified

In addition in {[Nationally completed name] 20,000 IU soft capsules} and {[Nationally completed name] 50,000 IU soft capsules};

Iron oxide red (E-172)

6.2 Incompatibilities

Not applicable.

6.3 Shelf life

2 years

6.4 Special precautions for storage

Store in the original package in order to protect from light.

6.5 Nature and contents of container

Opaque PVC/PVdC-Alu blister

{[Nationally completed name] 25,000 IU soft capsules} is available in packs containing 1, 2, 3, 4, 8, 10, 12, 14, 20 or 50 soft capsules.

{[Nationally completed name] 50,000 IU soft capsules} is available in packs containing 2, 3, 4, 6, 8, 10, 14 or 50 soft capsules.

Not all pack sizes may be marketed.

6.6 Special precautions for disposal and other handling

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.
